

NAAN MUDHALVAN ARTS INTERNSHIP PROGRAM 2026

FRONTEND WEB DEVELOPMENT USING REACT

PROJECT SUBMISSION

STUDENT NAME: RUCHANA M

YEAR : 3

COLLEGE CODE: 0221

DEPARTMENT : COMPUTER SCIENCE

SEMESTER : 4

ROLL NO : 212401804

NMID : 2EF79316935A4CBAA8140D63A850322A

DATE : 22/06/2026

TITLE : COLLEGE ASSIGNMENT SUBMISSION TRACKER

GITHUB LINK : <https://github.com/Ruchana>

ABSTRACT:

The College Assignment Submission Tracker is a web application developed using React.js to help faculty manage assignment submissions efficiently. The system allows users to add assignments with details such as title, subject, and due date. Faculty can update the submission status as Submitted, Pending, or Late. The application provides subject-wise filtering for easy tracking. A dashboard displays the total number of assignments and their status counts. This reduces manual record keeping and improves organization. The project offers a simple and user-friendly interface for academic management.

PROBLEM STATEMENT:

Many colleges still use manual methods to track assignment submissions, which can lead to errors and delays. Faculty often find it difficult to monitor assignments across multiple subjects. Identifying pending and late submissions requires additional effort. There is a need for a centralized system to manage assignment

records efficiently. The absence of proper tracking can affect academic performance

monitoring. This project addresses these issues by providing a digital solution. It helps faculty save time and maintain accurate records.

OBJECTIVES:

The main objective is to develop a React-based application for assignment tracking. The system should allow users to add and manage assignments easily. It should provide options to update submission status. The application should support subject-wise filtering. It should display dashboard statistics for quick analysis. The project aims to improve efficiency and reduce paperwork. It also helps faculty monitor assignment progress effectively.

PROJECT SCOPE:

The project is designed for use in colleges and educational institutions. It focuses on managing assignment information digitally. Faculty can add assignments and track their status in real time. The application supports multiple subjects and due dates. Dashboard reports provide a clear overview of assignment records. The system can be expanded in the future with student login features. It serves as a foundation for a complete academic management system.

TECHNOLOGIES USED:

React.js is the primary technology used for developing this project. It is a JavaScript library used to create interactive and dynamic user interfaces. React follows a component-based architecture, making the application easy to develop and maintain. The project uses functional components to build different sections of the application. React Hooks are used to manage data and user interactions. The virtual DOM improves application performance by updating only the necessary parts of the page. React provides a smooth and responsive user experience for assignment management.

APPLICATION TOOLS:

React.js is the main application development tool used in this project. It helps create reusable components such as forms, dashboards, and assignment lists. React allows developers to build single-page applications with efficient rendering. The tool supports easy state management and dynamic content updates. It simplifies the development process through its modular structure. React improves code reusability and maintainability. It is widely used for developing modern web applications due to its flexibility and performance.

KEY REACT CONCEPT USED:

The project uses React Components to create reusable UI elements. Functional Components are used for better performance and simplicity. The useState Hook is used to manage assignment data dynamically. Props are used to pass data between components. Event Handling is used for form submissions and status updates. Conditional Rendering is used to display different assignment statuses. List Rendering is used to display assignment records efficiently.

EXPECTED TOOL:

The application will provide a dashboard displaying assignment statistics. Users can add new assignments through a form interface. All assignments will be displayed in a structured list or table. Faculty can update assignment status easily. Subject-based filtering will show assignments related to a selected subject. Dashboard cards will display submitted, pending, and late counts. The system will provide a clear and organized view of assignment records.

CHALLENGES FACED:

Managing dynamic assignment data can be challenging during development. Implementing state management correctly requires careful planning. Updating assignment status in real time needs proper event handling. Maintaining data persistence using Local Storage may require additional testing. Creating a responsive user interface can also be challenging. Ensuring accurate dashboard calculations requires proper logic implementation. Debugging React components may take additional efforts.

LEARNING OUTCOMES:

This project helps in understanding React.js fundamentals. It improves knowledge of component-based architecture. Students learn how to manage application state using React Hooks. The project enhances skills in JavaScript, HTML, and CSS. It provides experience in building interactive web applications. Students gain practical knowledge of data handling and filtering techniques. It also develops problem-solving and debugging skills.

CONCLUSION:

The College Assignment Submission Tracker provides an effective solution for managing assignment records digitally. The system simplifies the process of tracking submissions across multiple subjects. React.js enables the development of a responsive and interactive user interface. Dashboard summaries help faculty monitor assignment status quickly. The application reduces manual work and improves efficiency. It serves as a useful tool for academic management. Overall, the project demonstrates the practical use of React.js in developing real-world web applications.
